home and business

# Xpanda Saftidor

**Saftidor** is designed for applications where aesthetics are a key consideration. There is a choice of locking systems and unlike conventional retractable gates, **Saftidor** does not use top or bottom tracks making it very easy to operate. The square steel lattice sections are connected by high tensile rivets and allow the **Saftidor** to fold to just 15% of its locked size. In addition, a unique hinge aside facility enables each sash to turn through up to 180 degrees, thus enabling unrestricted access to be retained.

All components are phosphate treated and finished in a resilient white gloss coating. **Saftidor** provides an attractive visual deterrent against traditional break-in methods. The wide range of standard stock sizes can be quickly and easily fitted in almost any setting, including commercial, domestic and industrial applications. Used in combination, this system is also ideal for shop fronts, with no tracks or other fittings to obstruct the display of goods. **Saftidors** can be installed using adjustable posts at regular intervals to provide the necessary support without having to use top supports or tracks.

# Xpanda Saftiwindow

Based on the highly successful **Saftidor** retractable gate system, **Saftiwindow** is also available from stock to suit almost any size or shape of opening. The gates' sashes fold back quickly and easily to provide maximum visibility when not in use. In domestic situations, they can be completely concealed behind curtains when open. Fitting on the inside deters would-be thieves, who must break the glass before they can tackle this security measure.
